Transport Layer - IV (Reliability & Flow Control)

Ensure Reliability at the Transport Layer

Error Control and Flow Control

These features are used in both Data Link Layer and Transport Layer
 Why?

Flow control and error control at the transport layer is essential

Flow control and error control at the data link layer improves performance

Flow Control Algorithms

Stop and Wait Flow Control (Error Free Channel):

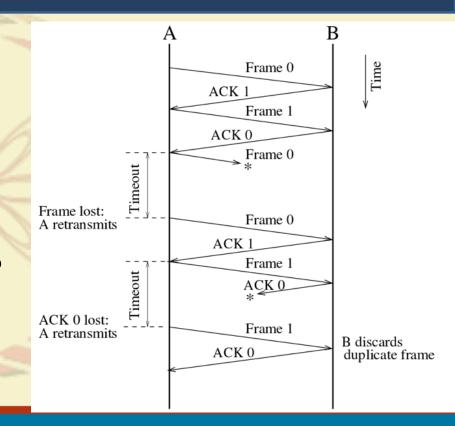

Flow Control Algorithms

- Stop and Wait (Noisy Channel):
- Use sequence numbers to individually identify each frame and the corresponding acknowledgement
- What can be a maximum size of the sequence number in Stop and Wait?

Automatic Repeat Request (ARQ)

Stop and Wait ARQ – Sender Implementation

sndpkt=make pkt(0,data,checksum) rdt_rcv(rcvpkt) && udt send(sndpkt) (corrupt(rcvpkt) | | start timer isACK(rcvpkt,1)) Λ rdt rcv(rcvpkt) timeout Wait for Wait for call 0 from udt send(sndpkt) ACK 0 above start timer rdt rcv(rcvpkt) && notcorrupt(rcvpkt) && isACK(rcvpkt,1) rdt rcv(rcvpkt) && notcorrupt(rcvpkt) stop_timer && isACK(rcvpkt,0) stop timer timeout Wait for Wait for call 1 from udt send(sndpkt) ACK 1 start timer above rdt rcv(rcvpkt) rdt rcv(rcvpkt) && (corrupt(rcvpkt)| isACK(rcvpkt,0)) rdt send(data) ٨ sndpkt=make pkt(1,data,checksum) udt send(sndpkt) start timer

rdt send(data)

Problem with Stop and Wait

- Every packet needs to wait for the acknowledgement of the previous packet.
- For bidirectional connections use two instances of the stop and wait protocol at both directions – further waste of resources

- A possible solution: Piggyback data and acknowledgement from both the directions
- Reduce resource waste based on sliding window protocols (a pipelined protocol)

Stop and Wait versus Sliding Window (Pipelined)
